OPERATIONALLY COGNISANT DESIGN – THE CAPITAL PROCESS

Nick Schilov & Allen Browne

17th NZ Transport Agency & NZIHT ANNUAL CONFERENCE

The Site(s)

Motorway Environment

- SH1 1050 / 2.760 – 3.810 D R2
- National Strategic High Volume
- Single lane treatment

CJP191 South of Whitford Brown

- Traffic
 - AADT = 27,863
 - HCV = 8%
 - DESA = 3.54×10^7
- Pavement
 - Lane R2 (outer)
 - Bound by R1 & Shoulder
 - Pavement 600mm+
 - Cracking & pothole repairs

The Key Contributors to Failure

Primary Material Concerns

OPERATIONALLY COGNISANT DESIGN

Nick Schilov & Allen Browne

17th NZ Transport Agency & NZIHT ANNUAL CONFERENCE

The Key Contributors to Failure

Drainage Issues

Depth (mm)	Pavement
0	OGPA with nothing notable RWP
30	Asphalt mix 15
130	Sandy fine to medium (40mm) GRAVEL, tightly packed; wet, well graded; angular sand fine to coarse, fines low plasticity.
260	Fine to coarse (60mm) GRAVEL, with sand, tightly packed; wet, well graded; subangular sand fine to coarse, fines low plasticity.
500	Become very wet.
600	End of pit

The Key Contributors to Failure

Failure Mode

TP6 - 3.54×10^7	Thickness (mm)	Modulus (MPa)	SL/NSL	Critical S train	Critical Damage Factor
Surfacing	65	1400	NSL	5.57E-04	2.96E+02
Basecourse	535	220	SL	n/a	n/a
Subbase	-	-	-	n/a	n/a
Upper SG1	250	50	NSL	6.26E-04	2.67E-01
Lower SG2	0	200	NSL	1.08E-04	1.21E-06

Traffic

- Lane MUST be open to AM peak
- Single central lane treatment - no steps transverse or longitudinal
- Need to ensure it's safe
- Speed intended to be 50km/h

The Options

Cement – No

- Traffic loading
- Moisture sensitivity
- Possible reversion to unbound
- Risk of cracking if bound
- Sensitive to cement%

AC – Maybe

- Status Quo for expressway single lane work
- Low design/construct risk
- Small productivity for multiple lifts
- Expensive sqm rate

Foamed Bitumen - Maybe

- Perceived risk over performance on motorways
- Materials respond well to mix design
- Able to be trafficked
- Substantially cheaper on sqm rate with improved productivity

The Treatment – Foamed Bitumen Single Lane

Checked Reactivity

Test Pit 2 (TP17) (RP 3.579 LWP)	40% Existing Basecourse + 30% Granulated Surfacing + 30% Winstones Belmont AP40	Foamed Bitumen Testing	2 nd Phase Modulus 1,342MPa
Test Pit 1R (TP16R) (RP 3.800 RWP)	70% Existing Basecourse + 30% <u>Horokiwi</u> AP40	Foamed Bitumen Testing	2 nd Phase Modulus 1,273MPa

How to Build It?

Mill off Surfacing

OPERATIONALLY COGNISANT DESIGN

Nick Schilov & Allen Browne

17th NZ Transport Agency & NZIHT **ANNUAL CONFERENCE**

How to Build It?

Import AP40 & Foamed Bitumen Stabilise to 250mm

OPERATIONALLY COGNISANT DESIGN

Nick Schilov & Allen Browne

17th NZ Transport Agency & NZIHT ANNUAL CONFERENCE

How to Build It?

Compaction

OPERATIONALLY COGNISANT DESIGN

Nick Schilov & Allen Browne

17th NZ Transport Agency & NZIHT ANNUAL CONFERENCE

How to Build It?

Run Traffic at low speed and VMS requesting HCV's use other lane (R1)

Typically 48 hours until milling

Mill off 50mm, tidy up and surface with membrane & OGPA

Finished Product

OPERATIONALLY COGNISANT DESIGN

Nick Schilov & Allen Browne

17th NZ Transport Agency & NZIHT ANNUAL CONFERENCE

What Did We Learn?

Learnings

Milling off the 50mm found surface texture rougher than hoped, but to be expected with 40mm aggregate and not strongly bound

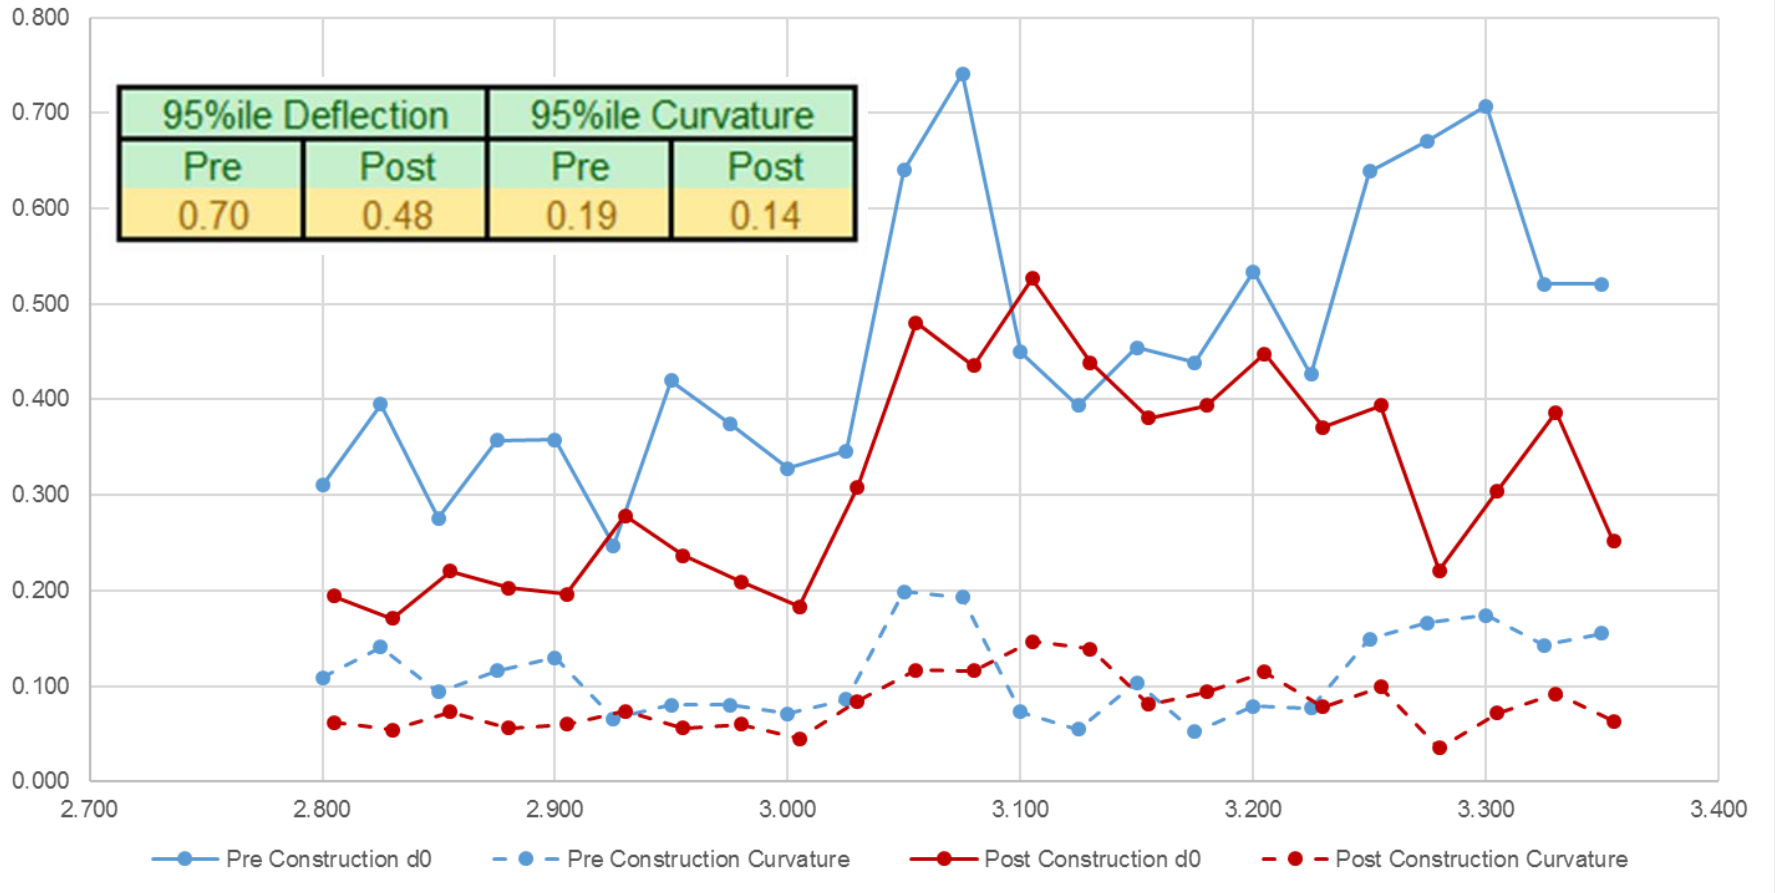

Some minor ravelling acceptable as long as loose material removed quickly

Traffic was speeding so bumper strips introduced

Performing well

Performance

SH1 - South of Whitford Brown - Pre and Post Construction FWD

OPERATIONALLY COGNISANT DESIGN

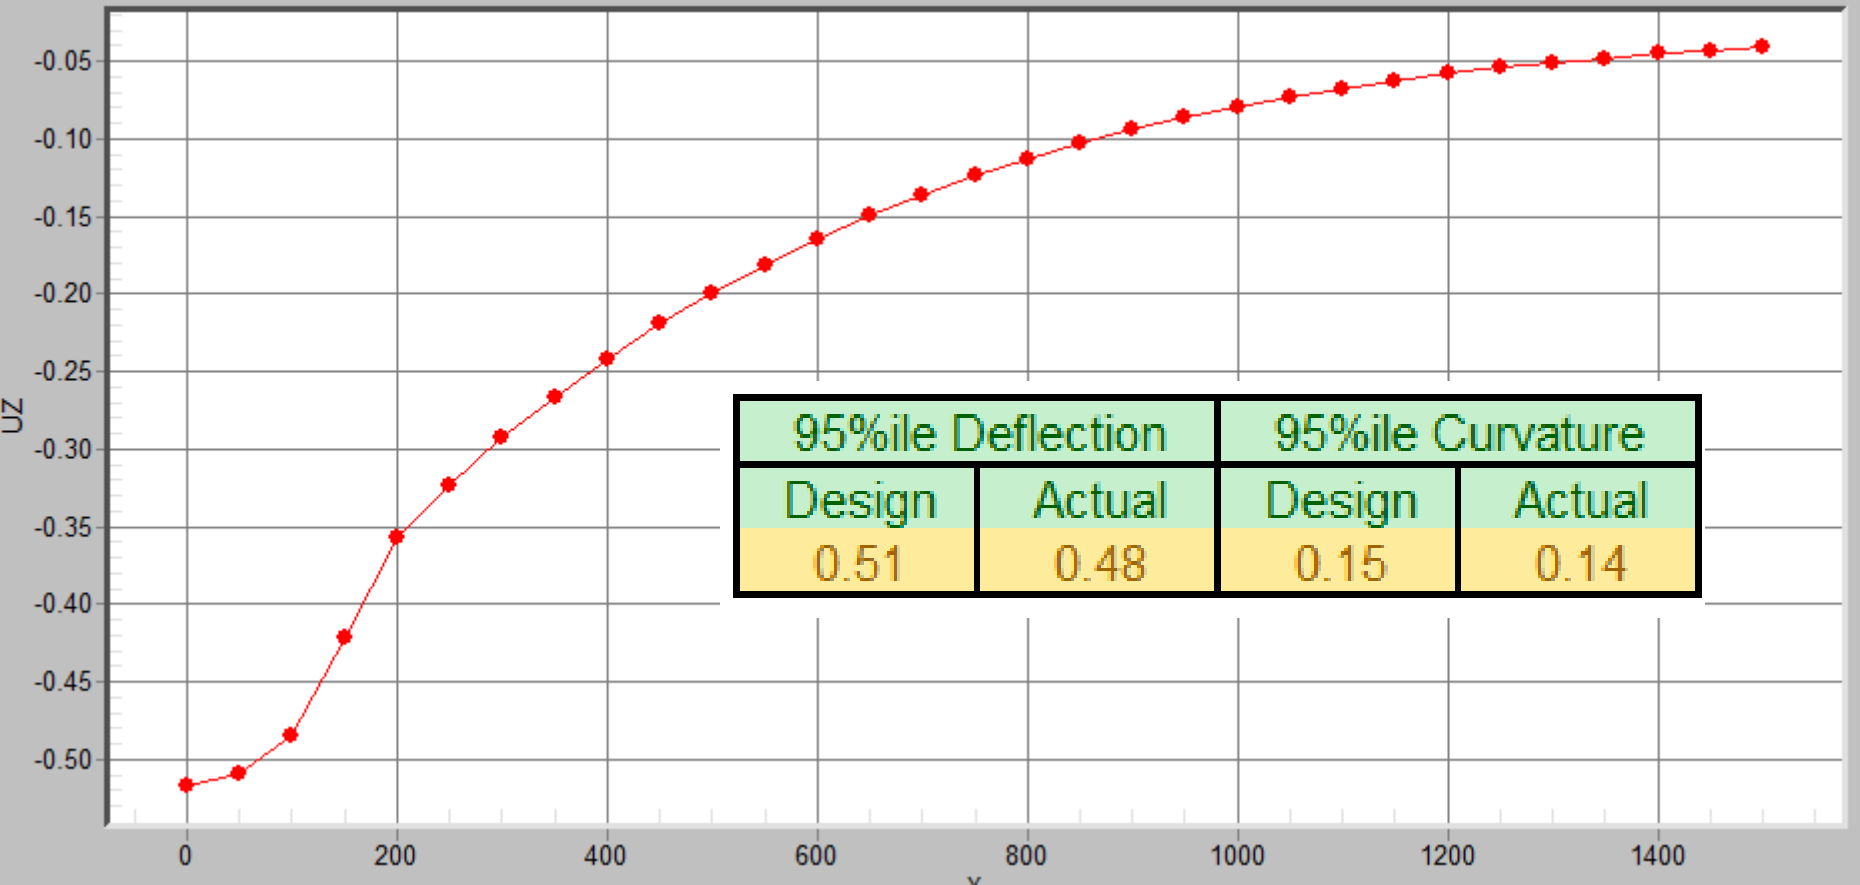

Nick Schilov & Allen Browne

17th NZ Transport Agency & NZIHT ANNUAL CONFERENCE

Performance

Wellington NOC 2016/17

CJP191 - South of Whitford Brown - Post Construction FWD Model

OPERATIONALLY COGNISANT DESIGN

Nick Schilov & Allen Browne

17th NZ Transport Agency & NZIHT ANNUAL CONFERENCE

What Next?

Continue with this successful treatment this season

Try finishing the stabilised layer to underside of surfacing – traffic constraints to be resolved

Ongoing monitoring

THE END
